Abstract

Experimental results are reported for gas-phase reactions of Fe^+ coordinated to the π-donating ligands C_2H_4, c-C_5H_5, C_6H_6 and C_{60} with N_2O and CO. Reaction rate coefficients and product distributions were measured with the selected-ion flow tube (SIFT) technique operating at 294 ± 3 K and a helium buffer gas pressure of 0.35 ± 0.01 Torr. The measurements provide intrinsic efficiencies for the primary and higher-order ligation of these XFe^+ cations with CO and N_2O and their corresponding coordination numbers. The coordination numbers are consistent with known ground state electronic structures. Many of the ligated ions were synthesized by ion/molecule ligation reactions in the gas phase for the first time, including $XFe(CO)_n^+$ and $XFe(N_2O)^+$ with X = C_2H_4, c-C_5H_5 and C_6H_6, $(C_{60})Fe(N_2O)^+$, $(C_{60})FeO^+$ and $(C_{60})FeO(N_2O)^+$. Also, the measurements provided an experimental assessment of the mode of bonding in $(C_{60})Fe^+$.

1. Introduction

Our recent SIFT measurements of rate coefficients for the sequential ligation of FeO^+ with inorganic ligands in the gas phase under thermal equilibrium conditions have demonstrated that such measurements are useful in the determination of the coordination number of Fe^+ ligated with atomic oxygen [1]. Here we report measurements of rate coefficients and product distributions for the reactions of Fe^+ coordinated to the π-donating ligands C_2H_4, c-C_5H_5, C_6H_6 and C_{60}. N_2O and CO were chosen as the reactant neutrals. N_2O was chosen because of its general importance as an oxidizing agent and because our experience with FeO^+ had shown that this molecule is a well-behaved ligand. CO has long been of importance in fundamental studies of the ligation of XFe complexes both in the gas phase and the condensed phase. The purpose of this study was twofold. We were interested in exploring intrinsic kinetic features of the ligation of the π-coordinated Fe^+ with N_2O and CO. Secondly, we expected that an understanding of the ligation of XFe^+ (X = C_2H_4,
